OnPrintShop Web2Print Solution Adds Workflow Integration using CSV/XML

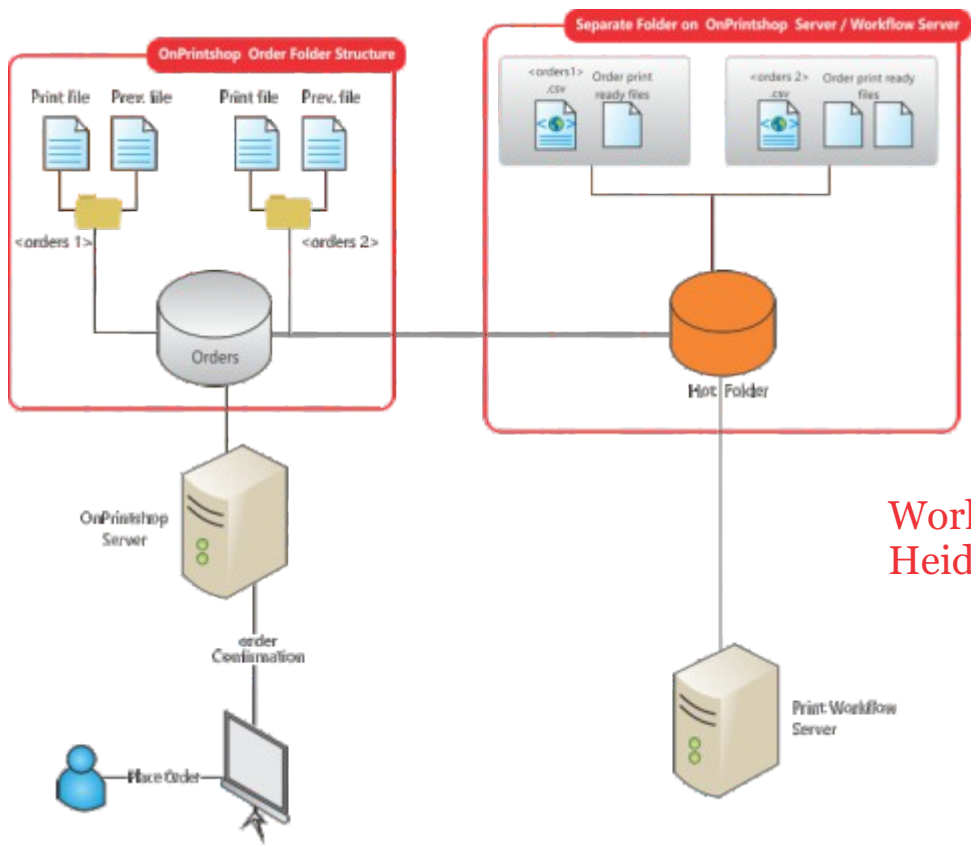

We are very happy to share that after being recognized for user friendly features, highly customizable solution, and personalized services now we have further integrated our web2print solution with PSPs' existing workflow solution. Integration with CSV/XML helps to improve productivity, reduce errors, and reduce turnaround time without increasing operation costs.

OnPrintShop web2print solution is an integrated online order management system and generates print ready PDF files. Users can place order with template or upload print ready files. The addition module of CSV/XML integration bridges the gap between online orders and workflow (hot folders) setup in production environment.

Orders are sorted by product & pushed automatically in

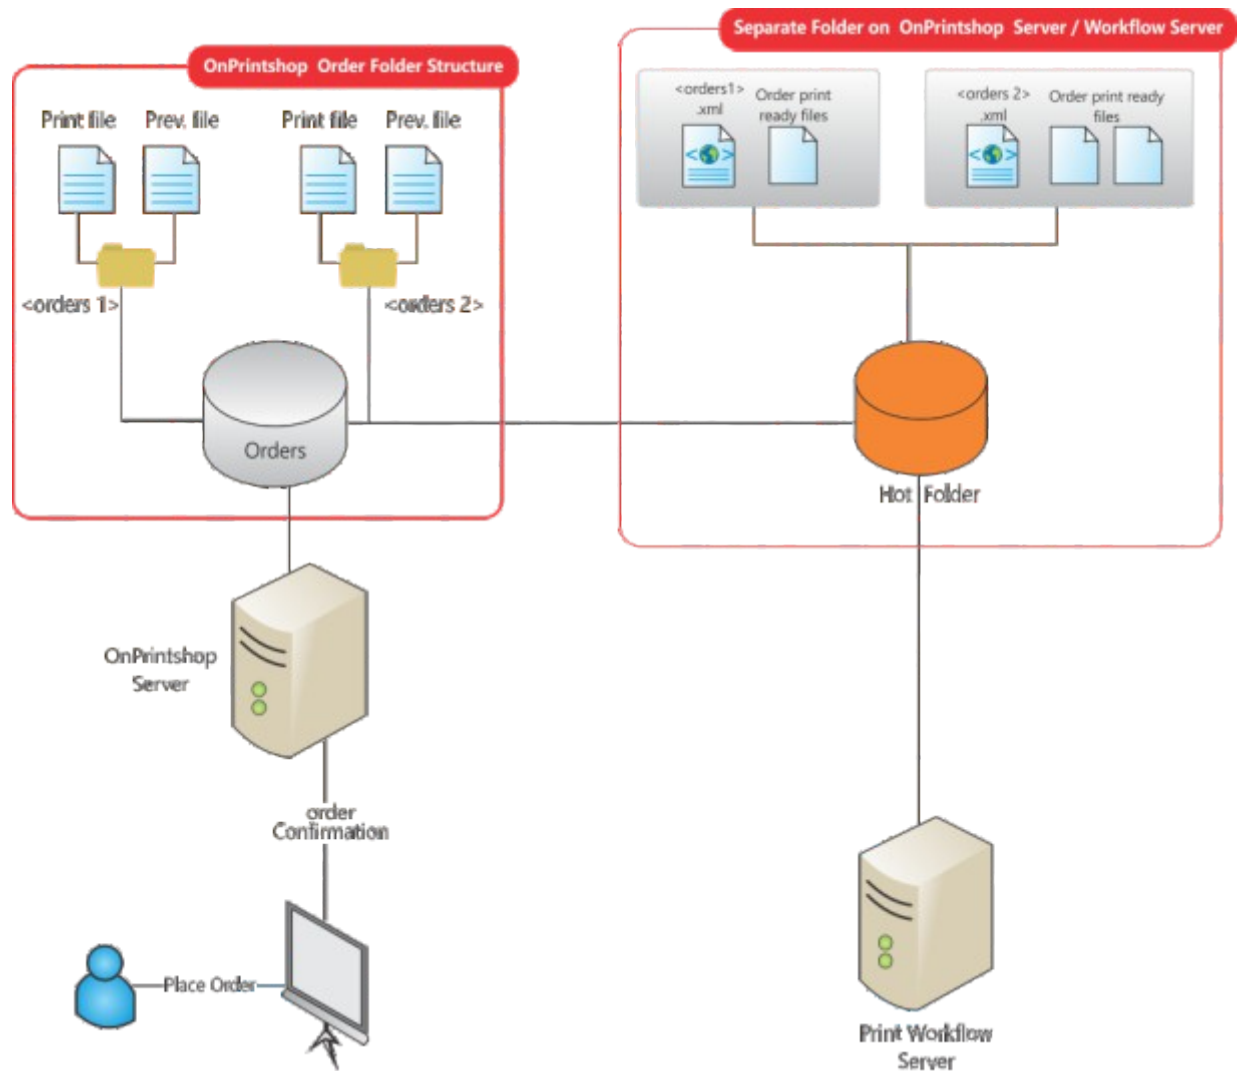

CSV/XML format to remote location in relevant folders. Our solution is designed as flexible or configurable where workflow can either pull orders from our server or we can push orders via FTP into remote destination. PSPs have an easy and cost effective add on workflow integration solution to automate the entire process from online order to fulfillment.

This way you have a completely integrated solution with least efforts and without making any changes to your existing workflow. You have an online personalized web store and user friendly admin panel to manage front store and clients and workflow integration using XML or CSV output. We have further developed high end customized workflow integration after understanding our clients' unique needs.
